Most integrated antenna for any Smart Meter IoT design

APPLICATION NOTE
TRIO mXTEND[™] (NN03-310)

SMART METERING

Nowadays, the main challenges faced by smart meter manufacturers, when designing a new metering device, are price, size, global coverage, long range and considering surrounding environments that could affect the overall performance.

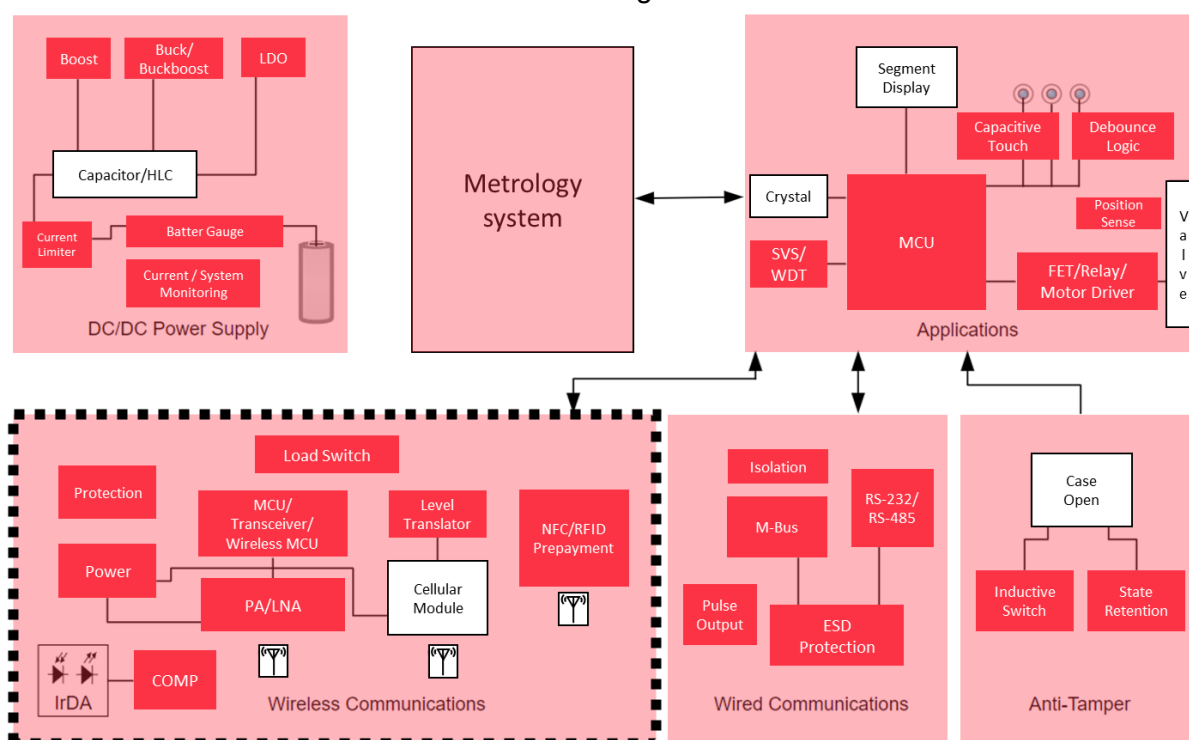

Any wireless smart metering device's data transmission has to be completely reliable, therefore, the antenna is a critical component in such device.

First, chip antenna technology is perfect for providing cost savings in your smart meter production. It is often a lower cost component than an external antenna or FPC, and, by being SMD pick and place, it provides savings on assembly costs.

The internally mounted chip antenna provides the benefit of increased protection against environmental factors and vandalism compared to an external antenna. Our patented technology, Virtual antenna® allows for the same antenna part to cover multiple frequency bands simultaneously and offers any device designer the flexibility of selecting and tuning the frequency bands simply through adjustment of the matching network. Virtual Antenna offers a predictable and optimized performance ensuring metering devices easily comply with cellular certifications.

Second, Virtual Antenna® components use the PCB to resonate, which enables high performance in space constrained device designs. Even with a small size Virtual Antenna® component, the metering device will perform with optimal efficiency and high gain in all the bands, helping with long-range communications.

Smart meters are subject to long product development cycles and massive deployment and installation. Altogether, this can span to several years. And it might happen that in the midst of the deployment, a new connectivity standard arises that improves the business model of the utility provider: e.g., using 5G instead of 4G or older 3G, 2G. A fast upgrade of the smart meter design becomes then very convenient and Virtual Antenna® ensures that the same component used for 3G will be capable of upgrading to 4G, 5G or any "G" with just a minimum change of the matching network. Even the same antenna can be used with non-cellular LPWAN standards such as LoRa and Sigfox.

Block Diagram of a Smart Meter

In the Block Diagram above, we see an example of a Smart Metering Application. Some of the main components within a device like this, are:

Microcontroller unit (MCU):

An MCU or MPU is an intelligent semiconductor and the main component in any device. It is what allows for the entire system to function, by translating the data programmed in it to commands that all the other components will understand and execute to deliver results. It is the brains of the module.

Choosing the best performing antenna will allow for a faster data transmission, which will lead the MPU to perform at its full capacity.

Metrology system:

Another especially important unit in a Smart Meter is the metrology system as the device needs to constantly measure the gas flow rate within an installation in a fully accurate way in order to be able to collect data, to be sent afterwards. In the next bullet point you can read how important the antenna is for the data collected by the metrology system to be correctly sent.

Antenna (Wireless Communications):

For optimal communication efficiency, the antenna's placement is crucial, therefore, its implementation within the device's design has to be in an early stage. That early implementation has to be done also because, usually, an antenna needs a clearance area in the PCB.

At this point, Virtual Antenna® technology becomes the best solution for any metering device. It gives the customer the ability to design the antenna set-up, in-house, with no expertise required. Furthermore, the customer will also be able to fine tune the performance given its overall product's structure from the beginning.

In summary, when designing a Smart Meter Device, the customer should think about the antenna at the early stage of the design process, as the location, PCB dimension and overall mechanics of the product will all determine/impact the overall performance of the antenna. Ignion can help and guide/advise the customer, using our Antenna Services. -By choosing Virtual Antenna® technology as your antenna solution, thanks to its high RF efficiency and adaptability, you will ensure best performance in your Smart Metering Device.

Moreover, Virtual Antenna® components, by being off-the-shelf, tunable, and versatile antennas, will allow for faster development times, predictability of design from minute one and a fast and flexible adaptation to different tracking forms.

In this application note, we will review the performance and different metrics, of the TRIO mXTEND™ (NN03-310), our top performing multiband, multiport antenna for Smart Metering.

TRIO mXTEND™: THE ANTENNA DESIGNED TO FIT ALL IoT SIZES

- **Product:** TRIO mXTEND™ NN03-310
- **Dimensions :** 30.0 mm x 3.0 mm x 1.0 mm
- **Frequency regions:** 698-960 MHz and 1710-2690 MHz

The IoT world and its IoT devices are a priority now for many companies. This is not a concept anymore, lots of devices become a reality and they need **wireless connectivity** at **many different frequency** bands as quick as possible and in the easiest way.

Sometimes **designers don't know the size or form factor of the future device** and moreover they don't even know the frequency bands to cover. So, **which antenna is the right selection? Do I need to wait till the last minute to choose the antenna?** The **answer is no**, you don't need to wait if you use Virtual Antenna® technology, the technology where **the component is always the same** regardless of the size or form factor of the printed circuit board. Having one antenna component for all sizes gives you the freedom to start with the antenna from the beginning, therefore optimizing the antenna to the limit, and if you need to change finally your design, the component remains the same because you change the desired frequency bands by only adjusting the matching network.

Within this application note you can check how the **TRIO mXTEND™** chip antenna component, the ultra slim, off the shelf component of only 1.0 mm height, can fit different board sizes by only adjusting its matching network. It also works in multiple frequency regions at the same time thanks to its modular, multiband and multi-port configuration.

Feel free to design your ideal new IoT platform, the antenna choice is only one.

TABLE OF CONTENTS

1. PRODUCT DESCRIPTION NN03-310	6

1. PRODUCT DESCRIPTION NN03-310

The market for the Internet of Things demanding cellular connectivity continues to grow and the expanding diversity of IoT devices means that product configurations are endless. For this application note we have tested the TRIO mXTEND[™] chip antenna component (NN03-310) performance when mounted onto various sized ground planes. We show the impact of ground plane size on performance in order to provide the most relevant results for those who design IoT devices of various dimensions.

Material: The TRIO mXTEND[™] chip antenna component is built on glass epoxy substrate.

APPLICATIONS

- Handsets
- Smartphones
- Tablets
- Laptop PCs
- Smart Meters
- Smart City/Building/Home
- Trackers
- Fleet management
- IoT Devices
- Modules

BENEFITS

- High efficiency
- Small size
- Cost-effective
- Easy-to-use (pick and place)
- Multiband behaviour (worldwide standards)
- Off-the-Shelf Standard Product (no customization is required)

The TRIO mXTEND[™] chip antenna component has been specifically designed for providing the major level of flexibility to operate any required frequency band inside any wireless device. TRIO mXTEND[™] chip antenna component is capable of operating the main mobile communication standards 2G, 3G, 4G (698-960MHz and 1710-2690MHz), the main short range wireless bands such as Bluetooth and Wi-Fi (2400-2500MHz and 4900-5875MHz), as well as the Global Navigation Satellite Systems (GNSS) such as GPS, Galileo, GLONASS, and Beidou (1561 MHz, 1575 MHz and 1598-1606 MHz), all through the same antenna component.

The TRIO mXTEND[™] chip antenna component offers the flexibility to be tuned at the frequency regions of interest through the proper adjustment of the matching network. This characteristic provides an important benefit since removes the need of including different antenna parts inside the same wireless device for operating different communication standards, thus reducing considerably the integration complexity while saving costs. The results gathered herein presents how the matching network should be configured for operating the main cellular communication standards when regarding different Printed Circuit Board (PCB) sizes.

2. ONE ANTENNA, MANY DEVICES

2.1. PERFORMANCE IN DIFFERENT PCB SIZES

For demonstration purposes, the performance of the TRIO mXTEND[™] chip antenna component is measured in different evaluation boards within the 698-960 MHz and 1710-2690 MHz frequency range, as used in many cellular IoT devices. Please note that the TRIO mXTEND[™] is able to cover a much wider range of communication standards such as GNSS and WiFi/BT through the same antenna package.

If your IoT device needs to operate in some additional standard or in some particular bands inside the 698MHz to 3800MHz frequency range you are welcome to contact support@ignion.io for assistance.

Each PCB board in the following set-up integrates a UFL cable to connect the TRIO mXTEND[™] chip antenna component with a SMA connector so that VSWR and antenna efficiency can be tested. The following results cover a wide scope of PCB sizes (length (A) and width (C)) (Figure 1), ranging from 142mm x 60mm down to 50mm x 50mm.

Figure 1 – Evaluation boards with different PCB dimensions that provide operation from 698 MHz to 960 MHz and from 1710 MHz to 2690 MHz.

Measure	mm
A	142 - 50
B	130 - 38
C	60
D	9
E	40
F	20
G	12
H	10
I	50

Tolerance: ±0.2 mm

D: Distance between the TRIO mXTEND[™] chip antenna component and the ground plane.

Material: The Evaluation Board is built on FR4 substrate. Thickness is 1 mm.

Clearance area: 40mm x 12mm (ExG)

2.2. VSWR AND EFFICIENCY

VSWR (Voltage Standing Wave Ratio) and Total Efficiency versus Frequency (GHz).

Figure 2 – VSWR and Total Efficiency for the 698 – 960 MHz and 1710 – 2690 MHz frequency range. Graph dimensions in the legend refer to BxC (Figure 1).

Ground Plane dimensions (B x C)	LFR (698 – 960 MHz)					HFR (1710 – 2690 MHz)				
	η_a 698 MHz	η_a 960 MHz	Min	Max	Av. η_a	η_a 1710 MHz	η_a 2690 MHz	Min	Max	Av. η_a
130mm x 60mm	42.0	56.5	42.0	65.7	60.1	59.1	58.5	57.3	8.8	74.3
80mm x 60mm	24.2	25.5	24.2	37.9	31.2	63.0	38.0	38.0	72.7	62.5
60mm x 60mm	12.2	24.0	12.0	34.4	25.0	69.9	41.8	41.1	85.9	68.9
40mm x 60mm	9.6	22.1	9.6	25.1	17.8	69.2	59.6	45.7	74.9	58.8
38mm x 50mm	8.4	13.8	8.4	18.0	14.0	46.9	36.1	28.7	52.0	38.2

Table 1 – Total efficiency (%) comparison considering the different PCB sizes (Figure 1).

2.3. MATCHING NETWORK

The matching network design and value components for each device and PCB size is provided here. While the antenna component and matching network design and topology remains the same, the value of the components will be adapted to every PCB size for an optimum performance. The specs of a Ignion standard product are measured in a reference evaluation board, to isolate the antenna performance from other system elements. However, when incorporating into real designs, nearby components such as LCD's, batteries, covers and connectors may affect the antenna performance. For this reason, placing pads compatible with 0402 and 0603 SMD components for a matching network as close as possible to the feeding point is highly recommended. The matching network should be implemented in the ground plane area rather than the clearance area, this will provide a degree of freedom for tuning the TRIO mXTEND™ chip antenna component once the design is finished, taking into account all elements of the system (batteries, displays, covers, etc.).

Please notice that different devices with different ground planes and different components nearby the TRIO mXTEND™ chip antenna component may require a fine tuning of the matching networks. To ensure optimal results, the use of high Q and tight tolerance components is highly recommended (Murata components).

If you need assistance to design your matching network beyond this application note, please contact support@ignion.io, or if you are designing a **different device size** or a **different frequency band**, we can assist you in less than 24 hours. Please, try our free-of-charge¹ [Antenna Intelligence Cloud](#), which will get you a complete design report including a custom matching network for your device in 24h¹. Additional information related to NN's range of R&D services is available at: <https://ignion.io/rdservices/>
